The terms used in this column are defined as follows:

* "T." placed in the column marks those sorts, usually sown in beds and later transplanted to the garden or field.

For the last planting of Beans, Sweet Corn, Peas and Radishes, or even Tomatoes, select the earliest varieties.

§ The usual distances are here given and the planter must use his judgment for his particular case.

† The Depth at which to plant seed cannot be given more than approximately. All seeds must have air, moisture and heat to germinate.

‡ "Early Spring," means as soon as buds in the trees begin to swell and the ground can be worked.

"Spring" refers to those vegetables which are not so hardy as above, and are planted later because they do so much better.

"Late Spring," is the time of year when the ground is well warmed and all frosts are passed.

("H") means plant in hotbed and transplant to open ground later.
("S") placed in this column means that those are grown for succession.

Garden Huckleberry (Wonderberry)

While classed as a fruit, it belongs in the same family as the tomato, being grown and cultivated in the same manner. It is an annual and produces fruit from seed the first year; is very easily grown and succeeds in any good soil. The seed should be started in boxes or cold frames and set out the same as cabbage and tomatoes and yields great masses of rich fruit all Summer and Fall. The fruit is as large as a grape and jet black when ripe. It is fine for cooking, having a flavor like the Huckleberry and makes delicious pies, jellies, preserves, jams, etc. Pkt., 10c; ¼ oz., 30c.

Improved Giant Sunshine Aster

Novelties, Specialties in Annuals

Marigold Harmony Dwarf French

Marigold—Double Harmony

The most truly remarkable break in the Dwarf French group. Formation of petals and unique color are suggestive of scabiosa. Center of flower is bright golden-yellow, and outer petals a rich maroon-red, creating a most striking appearance. Plants are very bushy and grow about 1 foot high. Pkt., 15c; ¼ oz., 35c.

"Crown of Gold"

Marigold

(All-America Gold Medal Winner for 1937)—One of the rare Marigolds in cultivation

with entirely odorless foliage; sweet-scented flowers on long stems. Unusual and attractive—the crown and collar of big, broad petals which surround it are of a bright, pleasing shade of clear golden orange. Flowers measure 2½ in. across. Plants grow to 2 ft. tall, early flowering, bloom profusely all summer. Pkt., 15c; ¼ oz., 45c.

Burgundy Petunia

With the introduction of this new variety the Large Single Flowered Petunias have been enriched by a most unusual and valuable color—deep Burgundy-red enhanced by a rich velvety sheen. The white throat, veined purplish red, creates a pleasing contrast. Flowers measure 3½ in. (See cut.) Pkt., 20c; 3 pkts., 50c.

Salmon Supreme Petunia

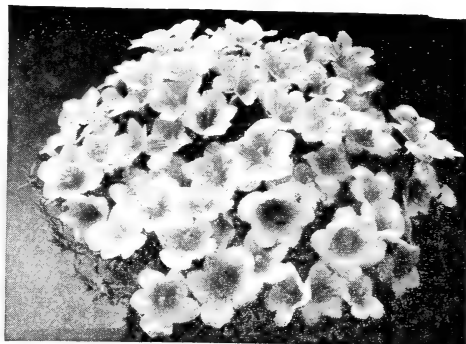

(All-American for 1938)—An entirely new Petunia color.

Flowers, when first opening, are of a rich coral-salmon, changing as they mature to a glistening soft salmon-pink. They grow 2 in. across and are deeply five-lobed. Plants have a nicely rounded form which is retained throughout the season. The plants have a uniform height of about 1 ft. and spread of 1½ ft. Profuse branching, unusually floriferous. Pkt., 35c; 3 pkts., \$1.00.

Linearis Zinnia

A most unusual new type belonging to the dwarf varieties. Flowers single and in a lovely shade of golden-orange with a delicate lemon-yellow stripe through each petal. The center is dark brown in the young flower, turning golden-orange as it develops. An early bloomer commencing when plants are about six inches tall and continuing through the season. Plants reach a height of 8-10 inches, spread of 2 feet. Flowers in great profusion, literally hundreds being open at one time. The most prolific bloomer of all annuals. Pkt., 20c; 3 pkts., 50c.

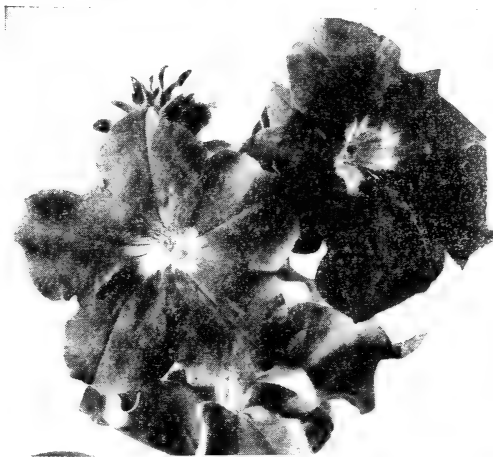

The Entire List of Flower Seed Is Prepaid. You are as close to us as your Postoffice.

Dwarf Cup Flower

Dwarf Cup Flower (*Nierembergia Hippomanica*) — This new introduction is one of the outstanding dwarf flowers in cultivation. With the exception of *Zinnia Linearis* it outblooms them all. It starts flowering when the plants are about two inches tall, which

is about 15 weeks after seed is sown and keeps on flowering until severe frost in the late fall. Plants are dwarf and compact, not over 5-6 inches high, with a spread of about 8-10 inches. As an edging plant for borders or outline of beds it is without equal; and it also is a remarkable plant for rockery. It is really a half-hardy perennial and will winter if given some protection. Pkt. (200 seeds), 25c.

Hardy Perennial Plants and Seeds

You'll enjoy a Rock Garden. For this purpose use any of the varieties marked (R).

Perennials planted once are always there; the flowers become better as plants grow older. It requires more time for the plants to come to flowering size when seed is planted. Sow the seed outside in early spring or summer and transplant when plants are large enough to place where you wish. To those desiring bloom the first season we offer plants which will give such results. (See prices below.)

New Hardy Chrysanthemums

New Korean Chrysanthemums

These new creations are especially fine for cold climates where the ordinary Chrysanthemum winter-kills. They are most attractive in color, very early blooming, easier to grow and more profuse. The color effect in the garden is very effective.

P.-W.'s Colorful CANNAS

Cannas for Beds and Borders

Cannas are the most economical and effective plants employed in our Gardens. They bloom from early summer until frost in all sections of the country, succeeding in any sunny position in any kind of soil, but responding quickly to liberal treatment. For best results the beds should be spaded about two feet deep, and a generous amount of well-decayed manure of any kind thoroughly incorporated, and at all times freely watered. They are most effective when planted in masses of one variety, setting out the plants about two feet apart; The dormant roots should be planted inside in February or March and transplanted out-of-doors in the middle of May when weather is warm and settled. Do not water too freely until well started, then they should have an abundance. Plants 18 inches apart. We list four of the best cannas in cultivation:

Hungaria (3½ feet) The best pink Canna. Leaves bluish green, never burn. Flowers very large, with immense petals. Three-inch pot plants.

GLADIOLUS

Easily Grown
Effective Display

A succession of bloom may be had from July to October by making plantings two weeks apart from the end of June. To make a good show they should be planted from five to six inches apart each way, the large bulbs being covered about six inches deep, small ones about four to five inches. Frequent cultivation with a hoe or a weeder, around the base of the plant, to prevent the soil from becoming hard and dry, is advisable. Where desired for garden decoration or exhibition, we advise plants being staked after attaining the height of one foot. (We offer light green dyed bamboo canes, which are excellent for this purpose.) Water copiously, and as the flower-buds begin to form, apply Vigoro (see page 79) for the best results.

HOW TO CONTROL THRIPS

These tiny, destructive insects cause a silvered appearance on the foliage and a drying of the flower-buds, and a general blighting of the plant.

Gladiolus corms obtained from us have been given every protection against Thrips. You should, however, continue treatment after you receive them. We recommend:

Before Planting

1. Remove the skins, so that "bare" corms are planted. Do not injure the growing tips when doing this. Burn skins.

2. Stir 2½ ounces of Semesan in one gallon of water. Immerse the bare corms in the liquid for a period of seven hours. Allow them to dry, then plant.

During Growth

3. Mix 1 ounce of Paris Green, 2 pounds of brown sugar and 3 gallons of water. Keep stirred, and spray the growing plants lightly but thoroughly with the mixture every 10 days until the first flower-bud opens.

When Bulbs Are Lifted

4. In autumn, cut off the tops from the lifted corms and burn them. Place the corms in a low, but not freezing, temperature to cure for six weeks.

5. Place in boxes covered with paper for one month. Use Naphthalene Flakes at the rate of one ounce per 100 corms, or one-half pound per 1000 corms. Avoid containers with close-fitting lids, because ventilation is necessary.

6. At the end of the month, shake out the Naphthalene Flakes, and store the treated corms in the usual way.

Note—Semesan and Paris Green are poisons, and care must be taken in their use. See page 85.

PLANS TO BEAUTIFY

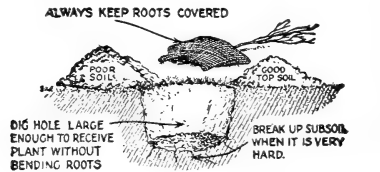

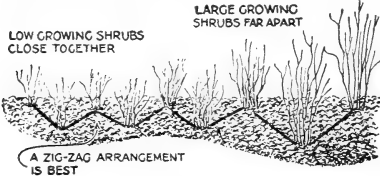

P.-W.'s Ornamental TREES and SHRUBS for Every Purpose

Neither the city nor the home is attractive unless softened by the foliage and branches of trees. They shelter the home from excessive heat and dust, add charm to the finest buildings and hide the untidy and unsightly places. There is an untiring loveliness as they continually change. At the first breath of spring, the swelling buds open into dainty flowers, often inconspicuous, but none the less beautiful. Then follow the delicate tints of expanding leaves that deepen into the richness of mid-summer green. The chill of autumn brings new beauty into the myriad of gorgeous hues that come almost overnight.

How to Plant Trees and Shrubs

Do not let the roots become dry. Keep them covered at all times with damp sacks or something similar.

Cut off broken or bruised roots just above place of injury. Shorten any roots that are overlong with a sharp knife or pruning shears. See below and next page.

NOTE—MANURE, UNLESS WELL ROTTED AND THOROUGHLY MIXED WITH THE SOIL SHOULD BE USED ONLY ON TOP IF USED AT ALL.

P.-W.'s Big Sweet CHERRIES

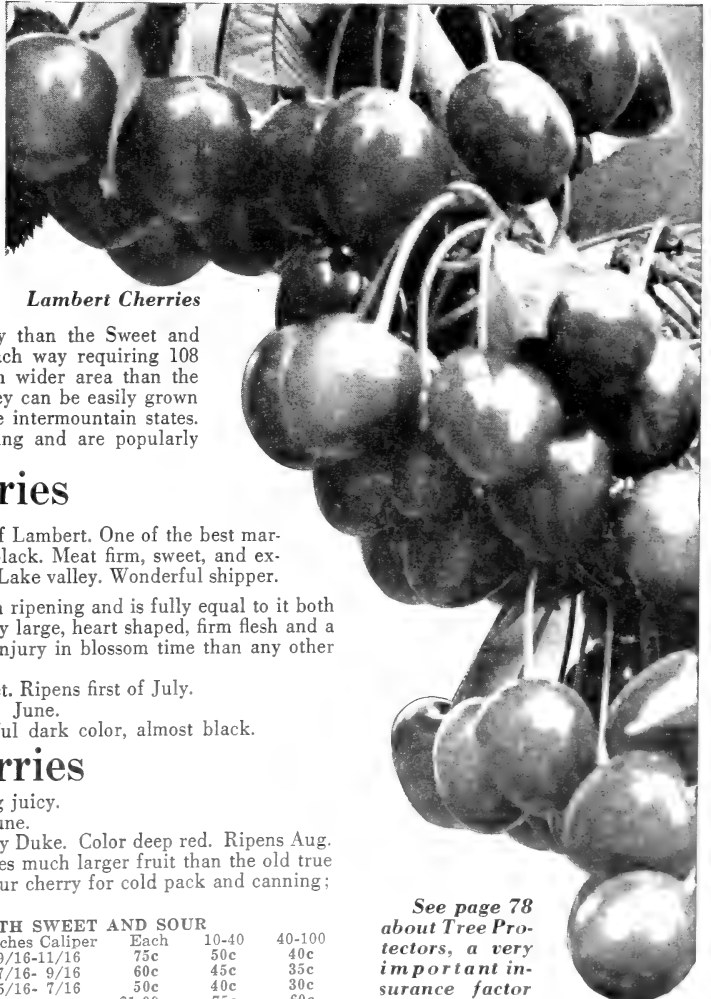

Typical Cherry Orchard in Full Bloom — Trees from P.-W. Co.

About Cherries

Cherry trees are a real asset to any home. Big sweet luscious cherries, fresh from the tree, will be appreciated by the whole family. No fruit surpasses it and few approach it. They thrive best in well-drained soil on which the water does not stand close to the surface. Sweet Cherries develop larger trees than the sour, and should be planted at least thirty feet apart each way (49 trees per acre). The Bing and Lambert varieties require pollinizers and we recommend planting the Black Tartarian for this purpose. One tree will pollinize several and in commercial plantings approximately one to twenty should be planted well distributed.

Sour Cherries are smaller trees at maturity than the Sweet and should be planted about twenty feet apart each way requiring 108 trees per acre. They are adaptable to a much wider area than the Sweet Cherries and require no pollinizers. They can be easily grown in the upper valleys and colder sections of the intermountain states. They are widely used for culinary and canning and are popularly known as the "pie cherry."

Culture of Small Fruits

Bramble fruits like blackberries, raspberries, dewberries, etc., should have all old wood (older than the previous season's growth) cut out close to the ground each spring and the past season's growth should be trimmed back to 3 or 4 ft. in height. All of the old canes should be removed and burned.

Mulching of currants and gooseberries will give good results. A strawberry bed should have a light mulch, after the ground has just frozen; and in the spring just about the time growth starts, this covering should be raked between the rows and cultivation resumed.

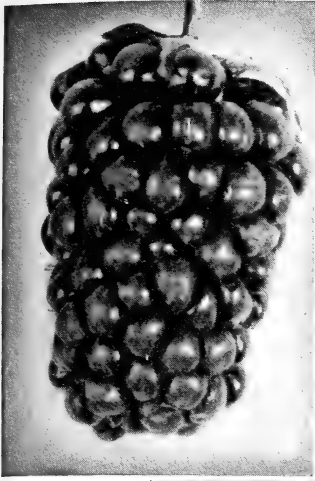

"RED STEER" Fertilizer will greatly hasten and increase production. (See page 78.)

Plant Small Fruit for Profit

Nothing in fruit growing at the present is attracting more attention than berry growing. Under suitable conditions as to soil, proximity to market or shipping point there is nothing more profitable. Our local markets, even in small towns, are never overstocked and will take everything offered at remunerative prices. Fill up those vacant spaces this year.

Small Fruit PLANTS and SHRUBS

ALFALFA

(LUCERNE) Wonder Crop of the West Why Alfalfa Pays Best of All Crops

1. Alfalfa is easier to start than clover.
2. It withstands drought because of its long penetrating roots.
3. It is the most nutritious hay for livestock.
4. It makes dairying pay better.
5. It also makes good green feed for poultry.
6. It is the best of all soil builders.
7. It exterminates weeds by crowding them out.
8. Good alfalfa seed brings a good price.
9. It is unequalled for hog pastures.

Prices on Alfalfa and Clover Seeds are subject to market changes. Ask for quantity prices. Seamless bags extra, at cost. Inoculate all Clovers. (See page 78.)

See page 2 for quantity prices not prepaid.

Grimm Alfalfa This variety is especially recommended for shallow soils or those underlaid with hardpan. The claim made for it is that in addition to extreme hardness it has spreading roots instead of a single taproot and that it makes underground creeping stems. Sow 10 to 15 lbs. per acre. We offer as follows:

N.B.—Certified seed cannot be delivered under seal in quantities less than 10 lbs. See page 2 for prices.

“**Yellow Tag**”—Certified Purity 98.5%. Lb., 75c, postpaid.

“**Blue Tag**”—Certified seed, purity 99.25%. Price, 75c per lb., postpaid.

Hardy Desert Alfalfa This splendid variety is the selection from the far famed Utah Dry Land type. It will live and thrive in the most trying arid situations where all others fail. Its roots pierce the soil until moisture is reached, even a depth of twenty to thirty feet has been traced in some dry localities. It produces even under adverse conditions but in favorable situations under irrigation it is a prodigious yielder. For dairy, poultry or stock feed it is unexcelled. Very desirable also as a rotate crop since it supplies the much-needed nitrogen and humus. Sow 10 to 15 lbs. per acre. Fancy grade: lb., 60c; 10 lbs., \$5.50, postpaid. See page 2 for quantity prices.

Clovers

Alsike Is recommended both for sowing with Timothy and also with the Red and Mammoth Clovers, as well as for a hay crop by itself. It does not winter-kill. The use of Swedish Alsike Clover is increasing rapidly; cattle prefer it to other clovers. It is very fine for honey bees. Sow at the rate of six or eight pounds per acre; sown in mixtures, five or six pounds per acre is sufficient. Lb., 60c; 10 lbs., \$5.50, postpaid.

Medium Red (*Trifolium Pratense*)—Is a dependable, all-around variety for farmers and stockmen. It makes two crops each year. Sow either in the spring or fall at the rate of fifteen pounds to the acre. Lb., 65c; 10 lbs., \$6.00, postpaid.

SWEET CLOVER—White Blossom

(*Melilotus Alba*)—Its value in the redemption of alkaline lands cannot be over-estimated. It grows in a variety of soils—heavy, light, wet or dry, almost anywhere, except in acid soil. Sow at the rate of 10 to 14 pounds per acre. Cover the seed very lightly. Lb., 30c; 10 lbs., \$2.50, postpaid.

Yellow Blossom (*Melilotus Officinalis*)—Same family as White Blossom Sweet Clover but it is not so prolific in growth and flowers are yellow instead of white. For bee pasture we believe it to be equally valuable. Lb., 30c; 10 lbs., \$2.50, postpaid.

See page 2 for quantity prices.

How to Handle Sweet Clover

Read what Mr. Schaerrer, a successful Utah farmer, says: “Sweet Clover. A splendid feed, a wonderful fertilizer and soil builder. Second to none. In the early spring plant 10 to 12 pounds of clover seed per acre with seeder attached to grain drill planting both Sweet Clover seed and grain at same time. With 2 or 3 irrigations will insure a good crop of both grain and clover. When grain is ripe, cut the grain rather high leaving one foot of stubble. When grain is harvested irrigate clover once more and it will give you from four to six inches more of splendid feed first year. Then harvest as you would alfalfa hay, gaining one and one-half tons of splendid feed the first year.

“Sweet Clover does not winter kill the first year and the following year it makes a very rapid growth. By the middle of May the clover will be from 12 to 15 inches high, then plow under as a fertilizer. Roots are very soft and easily plowed. This year the roots die leaving a well fertilized soil for any crop. Potatoes and sugar beets double their yield following this method.”

GRASS SEED — New and Special Merit

Crested Wheat Grass

(*Agropyron cristatum*)

This wonderful ranch and range grass is the first in the spring to become green and the last to dry out in the fall, furnishing a range over a long season. As a hay crop it is very highly nutritious and palatable, stands well under grazing, and as a seed crop produces from 200 to 400 lbs. per acre. It has made a most remarkable showing under very dry, arid conditions, succeeding where many other varieties fail in a dry situation and cold temperatures.

For hay and pasture sow 10 pounds per acre. As a seed crop, sow in 6 inch drills or in rows 3 ft. apart; requires only 3 pounds of seed per acre and is the best method to use under dry conditions when only a small amount of seed is available. Lb., **85c**; 5 lbs., **\$3.75**, postpaid. Write for quantity prices. (See cut, page 93.)

Western Wheat Grass

(*Agropyron smithii*)

This is a variety of great promise for the western arid regions. It is erect in growth and forms a firm solid turf even where moisture is very limited. It produces a uniform turf which makes it most suitable for fairways, roadside planting, and erosion control as well as an excellent range grass where rainfall is light. It supplies a long-felt need for a suitable sod-forming variety that will stand dry situations. Lb., **45c**; 10 lbs., **\$4.00**, postpaid. Write for quantity prices.

Slender Wheat Grass

(*Agropyron tenerum*)

A great boon for the cattle and sheep men. It grows in very dry arid sections and produces wonderful forage for cattle and sheep. It is a bunch-forming variety, and therefore would be more adaptable to range than to meadows. An acre of Slender Wheat Grass will pasture more sheep than any other variety we know. Very adaptable for pasture in canyons or flats. Lb., **40c**; 10 lbs., **\$4.00**, postpaid. Write for quantity prices.

Reed's Canary Grass

Reproduced from U.S.D.A. Bureau of Plant Industry

Reed's Canary Grass

(*Phalaris arundinacea*)

This is a tall grass with flat, wide leaves about one-half inch in width and elongated spike-like panicles. Thrives in wet areas and boggy soils.

A yield of 6 to 10 tons per acre is not unusual.

Sow early in the spring before the weeds begin to grow. Seeding may also be done in August or October if it is difficult to get onto the land in the spring. Sow it at the rate of 5 to 6 pounds per acre broadcast and in drill, 2 to 3 pounds per acre in 16 to 18-inch rows. For hay, cut as soon as the head begins to appear. Two or three crops of hay and some fall pasture may be obtained by such a practice. Everyone with moist and boggy soils should give this excellent grass a trial. Lb., **60c**; 10 lbs., **\$5.50**, postpaid. Write for quantity prices.

Western Alkali Grass

The seed is very fine and as it stools it should be sown very thin for a permanent crop. Seeding can be done from September 1 until spring; broadcast right on the snow and not after the snow is gone and land dries off and starts to crack. Use "Cyclone" seeder, sowing two pounds per acre for meadow or pasture. It is better to keep stock off in the spring, while plant roots are forming and the ground is soft. This grass will grow and produce a large crop, on either white or black alkali. It will make a fair crop the first year and a full crop the second year, and stand more summer drouth than any grass I have ever seen. The third year will be still better than the second. Price: lb., **\$1.00**; 5 lbs., **\$4.75**; 10 lbs., **\$9.00**, postpaid.

FARM SEED For Dairy Purpose

BEETS for Stock Feed

CULTURE—Sow seed in drills 24 to 30 inches apart and thin to about nine inches in row. Requires 8 to 10 pounds of seed per acre.

One of the most profitable crops known to agriculture. Just think of it: A yield of from 20 to 60 tons per acre and the feeding value, pound for pound, almost equal to grain; conservatively figured, just the average yield, therefore, would be the equivalent to a 1,000 bushel yield of oats, as far as feed value is concerned.

P.-W.'s Giant Sludstrup Easily harvested. Crops as high as fifty tons to the acre are not unusual. Color of skin reddish-yellow above the ground and light rose tint underneath.

Giant Half-Sugar Mangel—This half-sugar beet supplies a food of very much higher nutritive value for feeding purposes, pound for pound, than sugar beet, and the yield is more than double, early harvested. Price (see below).

Imp. Mammoth Long Red Mangel The extra large, long roots are blood-red in color and very nutritious. Enormously productive, yielding, under favorable conditions, as high as 70 tons per acre. Price (see below).

Golden Tankard—Flesh yellow, differing from others; sheep prefer it; a heavy yielder. Price (see below).

Danish Red Giant Eckendorfer—Of cylindrical form growing above the surface; heavy cropper. Price (see below).

Klein Wanzleben—One of the best, not largest, but richest in saccharine.

PRICE—Any of the above varieties of Mangels and Sugar Beets. Pkt., 10c; ¼ lb., 20c; lb., 50c; 10 lbs., \$4.00, postpaid.

For quantity prices see page 1

FIELD CORN - - Ensilage and Grain

Sow in drills 3 feet apart, using 15 to 40 pounds of seed per acre. When less grain and more bulk is desired more seed may be planted to the acre, giving a greater amount of leaf and stalk but less ear corn.

Minnesota No. 13—Acclimated here, it is one of the heaviest producers. Grows seven to eight feet tall, bearing ears nine or ten inches long, with medium deep kernels averaging sixteen to twenty rows on the cob. Splendid for ensilage. Matures 90 to 100 days.

Pride of the North—A yellow dent, tall-growing kind, luxuriant foliage, and vigorous grower. Ripens early. Excellent for ensilage or grain. Matures 85-95 days.

P.-W.'s Improved Leaming—Ears and kernels somewhat larger than Minnesota 13. Very heavy foliage, making it especially good for ensilage. Produces more tonnage to the acre than any corn we know. Matures in from 90 to 100 days.

King of the Earlyes—A yellow dent; very popular because of its earliness.

Silver King or Wisconsin No. 7—Best known white dent variety.

Northwestern Dent (Red)—A cross between a yellow dent and red flint. It is early and drought resistant. Matures in 75 to 90 days.

Australian or Sanford White Flint—One of the earliest white flints, it bears large ears averaging twelve rows, ten to fourteen inches in length. Stalks are medium height. Produces well for both dry corn and fodder. Season about 75 days.

A Field of Ensilage Corn

Boone County White—This is an excellent White Dent variety, maturing in 100 days. It is a great favorite among growers. One of the best for either grain or ensilage.

Any of the above varieties—lb., 20c; 10 lbs., \$1.30, prepaid.
See page 2 for quantity prices.

Mangels and Sugar Beets make splendid Winter feed—Plant them liberally.

Giant Half-Sugar Mangel

Water Gardens-Hardy Water Lilies

If your yard is too small for a large pool, you can at least enjoy a miniature. An attractive pool can be made in a small tub which requires a space no larger than four by four feet.

Hardy lilies are equally at home in concrete pools, half barrels, or tubs; and with a little care to prevent actual freezing of the roots, their beauty and fragrance may be enjoyed year after year. Lack of experience will not interfere with results, as water lilies "just grow" when provided with sunlight, rich soil and warm, shallow water.

If wanted, ask for Free Cultural leaflets when ordering.

Hardy Water Lilies

NOTE—All Water Lilies and shallow water plants can be shipped from early Spring until August, but it is best to order early so they can get a good start, also that you may not be disappointed in your selection.

Attraction—The petals are Garnet red, with almost white sepals. One of the choicest of all the water lilies. Flowers unusually large, sometimes 8 inches. One of the longest blooming hardy lilies. **\$1.75** each.

Chromatella (Yellow)—Perhaps the most popular of all. Sulphur yellow in color with broad curving petals. Blooms throughout the spring and summer months. Leaves are handsomely spotted with maroon. Vigorous, very hardy. **\$1.00** each.

Comanche—A rich apricot changing later to a deep copper bronze, to a glowing red in the depths of the flower. The best of the sunset colors, and very hardy. Charming. **\$1.50** each.

Conqueror—Large flowers 8 inches in diameter. Color, Cherry red, deepening with age, stamens orange-yellow, sepals almost white. Continually in bloom during the spring and summer. One of the showiest. **\$1.25** each.

Gloriosa—A truly remarkable red; satisfactory everywhere. Thrives under most extreme conditions. Blossoms delightfully fragrant and are often 6 to 7 inches across. One of the best. **\$1.50** each.

Gonnere—Snowy white, averaging eighty petals to the flower, making a nearly full globe. The leaves are small and it does not require much room to grow, but gives an abundance of blooms. One of the very few double water lilies. **\$2.00** each.

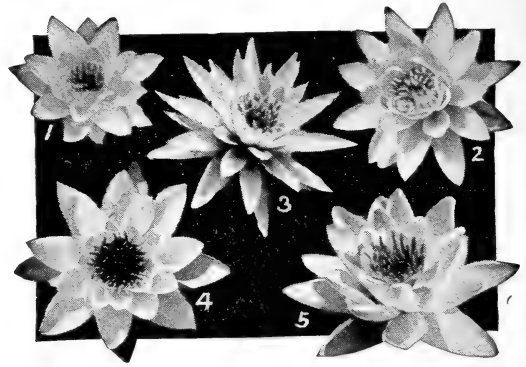

Marliac Pink—Pale, pink flowers of unusual size and abundantly borne throughout the entire season. One of the most popular pinks. A good strong grower, one of the best for the amateur. **\$1.00** each.

Marliac White—Snowy white petals with bright yellow stamens. The fragrant blossoms are five to six inches in diameter. Sepals are tinted with pink. In bloom continually. **\$1.00** each.

Rose Aray—Awarded the Silver Medal by the New York Horticultural Society. Undoubtedly one of the best of the Odorata section. A deep cerise pink sometimes reaching eight inches in diameter. Petals are of a starry, pointed form and very fragrant. **\$1.25** each.

Sunrise—Free blooming, clear sulphur-yellow; largest of all, often measuring eleven inches across, and carrying the flower several inches above the water. The leaves are almost egg-shaped, with crinkled sides, deep green above, and red flecked with dark brown below. **\$2.00** each.

Sacred Lotus (Hardy)—Immense flowers like gigantic roses 8 to 12 inches across, standing on stems one to

three feet above the water. Set among the great shield-like leaves, is a never-to-be-forgotten sight. Require the same care as water lilies. Plants spread rapidly and should be confined in boxes or tubs. **\$1.50** each.

Shallow Water Plants

Many interesting plants are found in this group, which are used both as marginal and as a pool decoration. They thrive in two to twelve inches of water and grow naturally about the margins of your pool or lake.

Arrow Head—Arrow-shaped leaves with small white flowers. Excellent for bog or shallow water. **25c** each.

Porcupine Grass—A hardy plant, with slim, graceful stalks, three to four feet high, variegated in color about every two inches from green to cream color, round like the quills of a porcupine. Good background. Something new. **25c** each.

Ribbon Grass (Variegated)—Splendid for use at the corners of your pool or along the walk. Leaves striped with white, very ornamental. **25c** each.

Floating Heart—Bright yellow, crepe paper like fringed five petalled flowers, size of a half-dollar. Leaves green blotched with maroon and floating on the water like a miniature lily. In bloom all summer, very hardy. **25c** each.

Parrot Feather—Green shoots trailing over the water, forms soft airy masses about the base of taller plants. One of the best for planting in fountain basins or along the rocks in pools. **25c** bunch.

Water Hawthorne—The leader among shallow water plants. The long, oval leaves lie flat on the water. White flower speckled with black, with fragrance like old English Lavender. Blooms all summer. Hardy. **50c** each.

Shell Plant—A beautiful floating shell-like plant, sending its slender roots down into the water. Spreads rapidly. Prefers a warm, shady situation. **20c** each.

Water Hyacinth—The delicate spikes of lavender flowers with peacock-like spots on the upper petals are most beautiful. The plants float on the water, but will produce more flowers when not allowed to drift about. **15c** each, 2 for **25c**.

SCAVENGERS FOR POOLS

All aquariums and pools need scavengers—fish to feed upon the insects, snails to devour algae and green scum. In all well-balanced pools goldfish and snails should be kept.

Japanese Snails—They devour algae and green scum, and help to keep the water clear. They do not lay eggs, but bring forth the young fully developed. 2 for **25c**.

Paper Shell Snails—Medium size snails with shell characteristics of their name. Very prolific egg layers, and are very active scavengers. **15c** a pair, **60c** a dozen.
